

### Abstract

An interdental brush having a brush part and a handle where the brush part is exchangeable characterized in that: the brush part has an insertion groove having facing planes at an angle of  $70^{\circ}$  to  $110^{\circ}$  to an axial direction of the brush; and the handle has a brush holding portion which holds the insertion groove, and an interdental brush set comprising the interdental brush and a brush container. In the interdental brush and interdental brush set of the present invention, by adopting specific attachment method of the brush part to the handle, a compact interdental brush with no foreign body feeling in the oral cavity where the brush part is exchangeable is provided. Further user can easily perform attachment and detachment of a brush part and disposition of used brush through one touch operation respectively without touching hands or fingers with the brush. And also dropout of the brush part during brushing is prevented.
